Network Layer: Data Plane 4-1

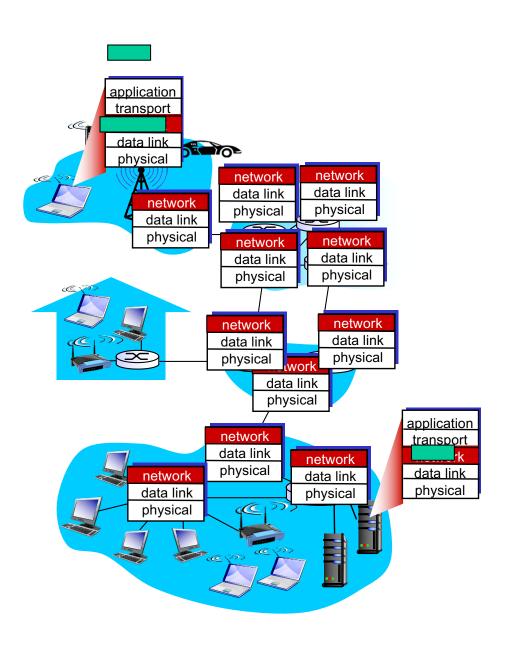

Chapter 4: outline

- 4.1 Overview of Network layer
 - data plane
 - control plane
- 4.2 What's inside a router
- 4.3 IP: Internet Protocol
 - datagram format
 - fragmentation
 - IPv4 addressing
 - network address translation
 - IPv6

- 4.4 Generalized Forward and SDN
 - match
 - action
 - OpenFlow examples of match-plus-action in action

Network layer

- transport segment from sending to receiving host
- on sending side encapsulates segments into datagrams
- on receiving side, delivers segments to transport layer
- network layer protocols in every host, router
- router examines header fields in all IP datagrams passing through it

Two key network-layer functions

network-layer functions:

- •forwarding: move packets from router's input to appropriate router output
- routing: determine route taken by packets from source to destination
 - routing algorithms

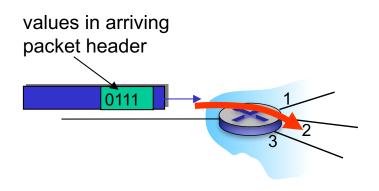

analogy: taking a trip

- forwarding: process of getting through single intersection
- routing: process of planning trip from source to destination
 - E.g. googlemaps

Network layer: data plane, control plane

Data plane (Forwarding)

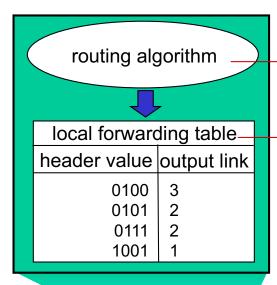

- local, per-router function
- determines how datagram arriving on router input port is forwarded to router output port
- forwarding function

Control plane (Routing)

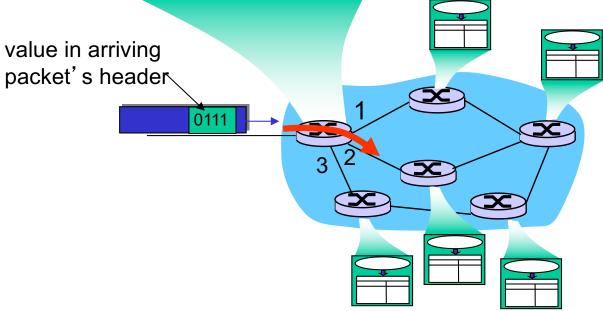

- network-wide logic
- determines how datagram is routed among routers along end-end path from source host to destination host
- two control-plane approaches:
 - traditional routing algorithms: implemented in routers
 - software-defined networking (SDN): implemented in (remote) servers

Interplay between routing and forwarding

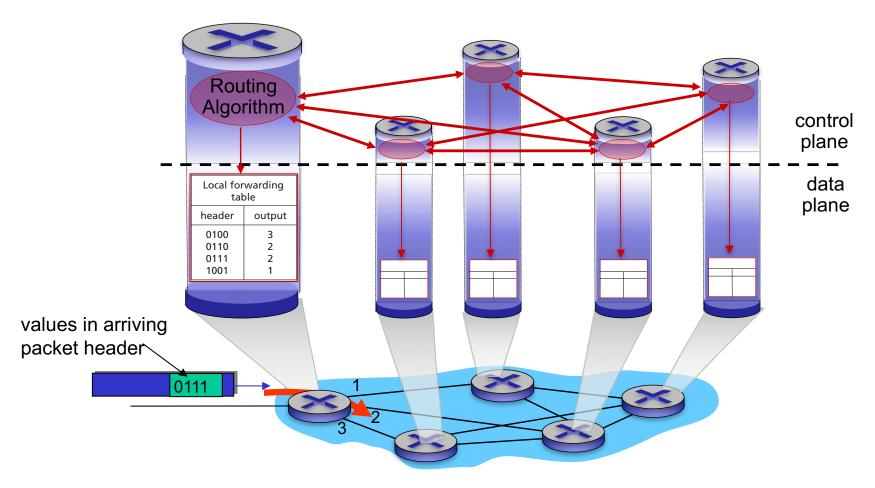

routing algorithm determines end-end-path through network

forwarding table determines local forwarding at this router

Per-router control plane

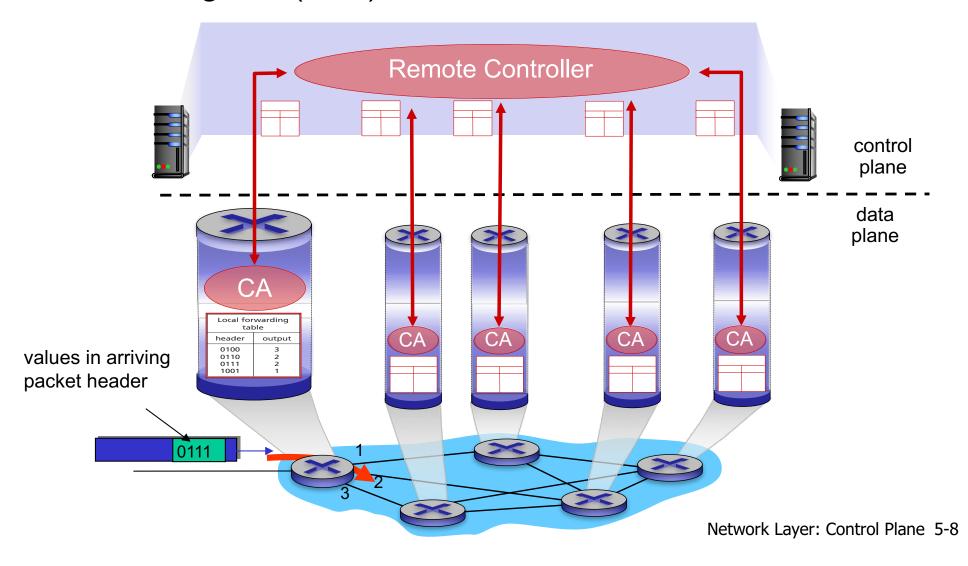

Individual routing algorithm components *in each and every router* interact in the control plane

Network Layer: Control Plane 5-7

Logically centralized control plane

A distinct (typically remote) controller interacts with local control agents (CAs)

Network service model

Q: What service model for "channel" transporting datagrams from sender to receiver?

example services for individual datagrams:

- guaranteed delivery
- guaranteed delivery with less than 40 msec delay

example services for a flow of datagrams:

- in-order datagram delivery
- guaranteed minimum bandwidth to flow
- restrictions on changes in inter-packet spacing

Network layer service models:

| N | Network nitecture | Service Model | Guarantees ? | | | | Congestion |
|------|----------------------|------------------|-----------------------|------|-------|--------|------------------------|
| Arch | | | Bandwidth | Loss | Order | Timing | feedback |
| | Internet | best effort | none | no | no | no | no (inferred via loss) |
| | ATM | CBR | constant rate | yes | yes | yes | no congestion |
| | ATM | VBR | guaranteed rate | yes | yes | yes | no congestion |
| | ATM | ABR | guaranteed minimum | no | yes | no | yes |
| | ATM | UBR | none | no | yes | no | no |

Network Layer: Data Plane 4-10
